

Assignment 2: *Cracking Windows Password and Hardening*

Lab Report Submission

Name: Greemesh Basnet

Student Number: 130525223

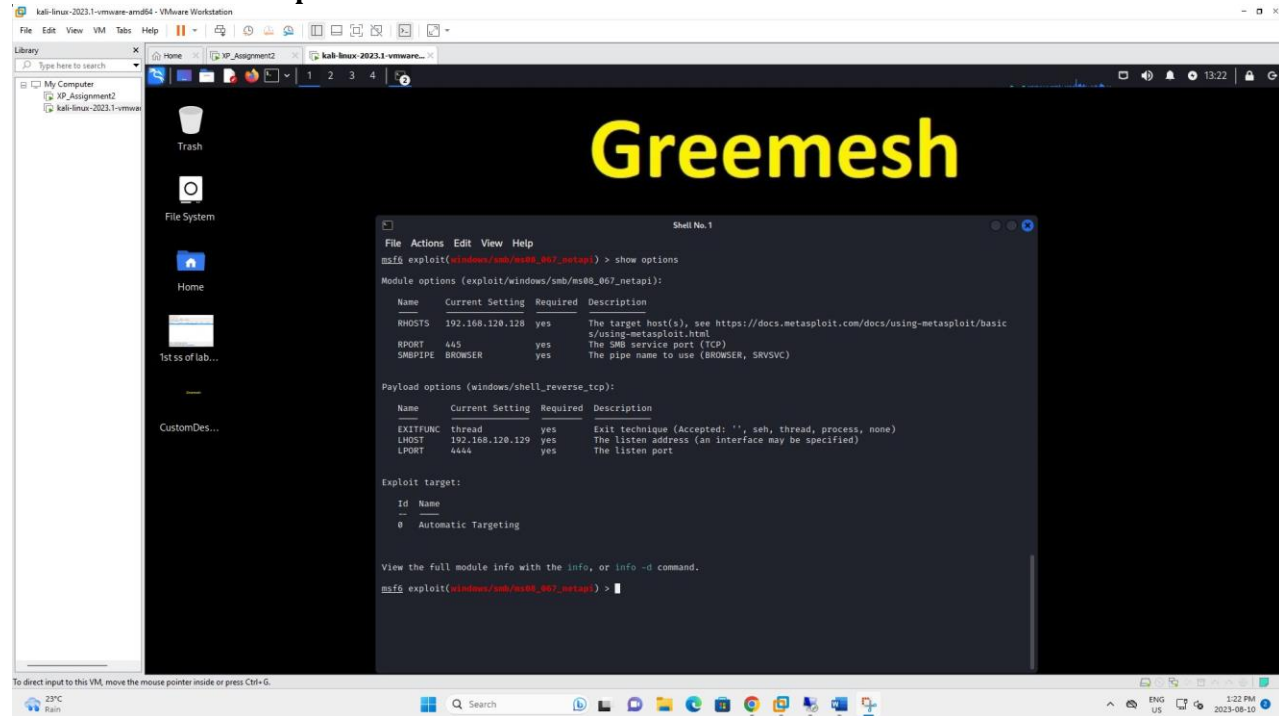

Screenshot of Windows Information

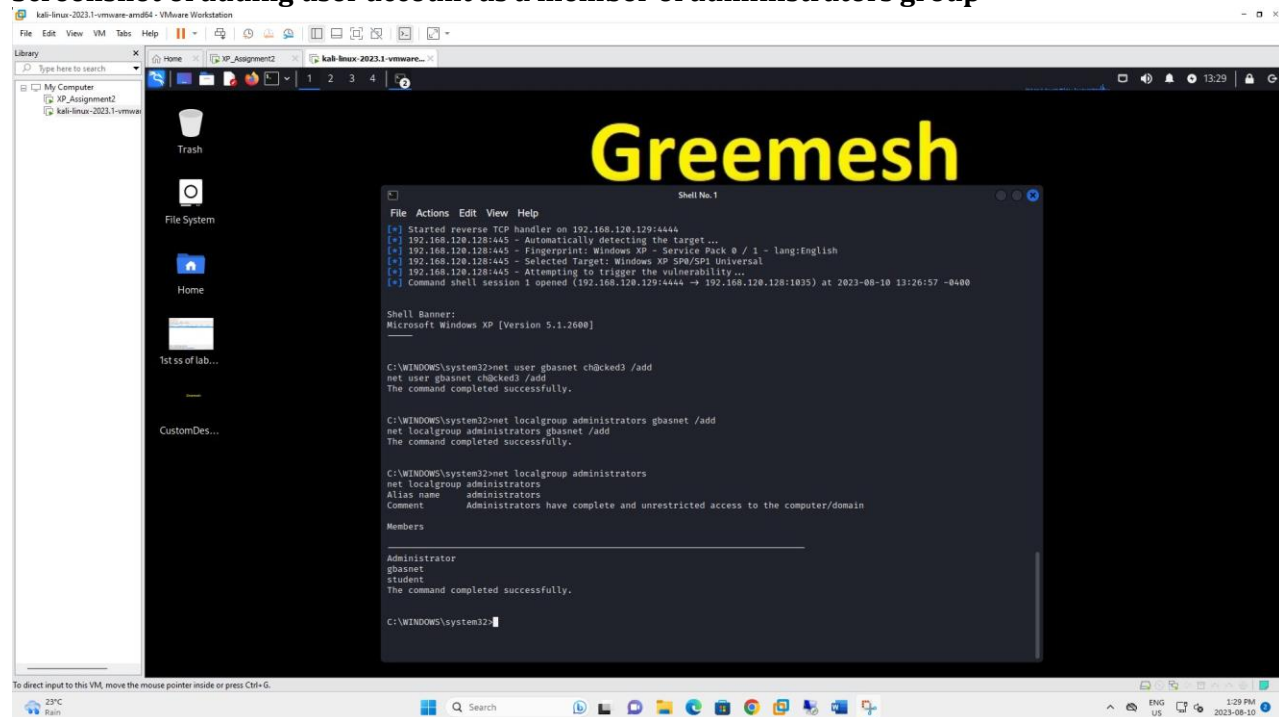

Q1. Why did you use payload? And why did you shell_reverse_tcp?

Answer: A backdoor for the attacker was built using payload. Establishing a connection from the target system back to their own system is done using shell_reverse_tcp.

Q2. How can you use the net command to show all local groups in Win XP?

Answer: As "net localgroup administrators," we must utilise the net command.

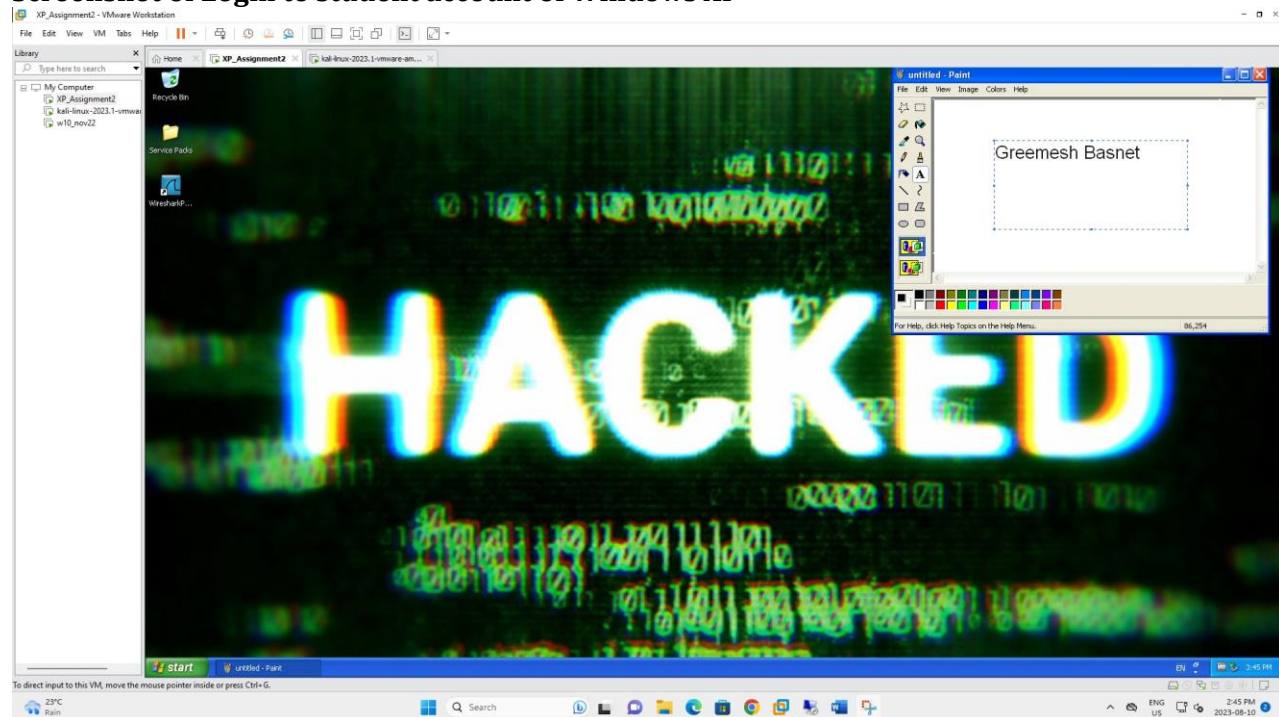

Q3. What is HKLM, and why does Windows use it?

Answer: HKEY_LOCAL_MACHINE (HKLM) is a root key that holds information about the local computer system. Windows uses a database to keep track of all users' and OS' setup settings.
